

Group 1

My idea is related with climate equality. As the top 1% emit as much as 2/3 of humanity. How can we achieve climate equality and what measures/control should we apply to these top 1%.

Panels will be:

- the top 1% representatives
- govt
- NGO fighting for climate equality
- climate scientists (both natural and social)
- mod

Beside that we also discussed these options:

Should we base the climate debate more on biodiversity loss and environmental degradation?

- * Moderators
- * IPCC climate scientist working on modeling the carbon cycle
- * Journalist or Politician
- * Expert on nature based solutions from IPBES
- * Activist concerned with shaping the public narrative to mobilize most people

How certain should we be that an extreme event will occur before a warning is issued to the population of the threatened region?

- Moderators (must be one group)
- Climate Scientists who work in a field where they receive inquiries on the topic or are directly part of a warning infrastructure
- Historians who've done or are doing research on the topic
- Politicians
- Citizens' representatives
